Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              of hits satisfying chosen parameters:

The sequence is that encoding SERK, a putative receptor kinase. It may be used as part of a method of producing apomictic seeds comprising: (a) transforming plant material with a nucleotide sequence encoding a protein which in active form in a cell or cell membrane renders the cell embryogenic; (b) regenerating the transformed material into plants or carpel-containing plant parts; and (c) expressing the sequence in the vicinity of the embryo sac. The apomictic seeds and embryos thus produced can be developed into plant progeny. This is useful in plant the developed into plant progeny. This is useful in plant can be developed into plant progeny. This is useful in plant the case that sexual plants are available as crosses with the case that sexual plants are available as crosses with the apomictic plant. Apomixis provides for true-breeding, seed propagated hybrids and could shorten and simplify the breeding programs combination could be eliminated. Apomixis allows plant breeders to develop cultivars with seed and forage quality and maturity.

of the embryo sac. The apomictic seeds and embryos thus produced
can be developed into plant progeny. This is useful in plant
breeding programs. Controllable and reproducible apomixis provides
many advantages in plant improvement and cultivar development in
the case that sexual plants are available as crosses with the
apomictic plant. Apomixis provides for true-breeding, seed
apomictic plant and could shorten and simplify the breeding
process so that selfing and progeny testing to produce and/or
stabilise a desirable gene combination could be eliminated.
Apomixis allows plant breeders to develop cultivars with
seed and forage quality and maturity.
Seed and forage quality and maturity.

The sequence is that encoding SERK, a putative receptor kinase. It may be used as part of a method of producing apomictic seeds comprising: (a) transforming plant material with a nucleotide sequence encoding a protein which in active form in a cell or cell membrane renders the cell embryogenic; (b) regenerating the transformed material into plants or carpel containing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Production of apomictic

        production of apomictic seeds - useful in plant breeding Claim 21; Pages 40-46; 123pp; English.

The sequence is that encoding SERK, a putative receptor kinase. It may be used as part of a method of producing apomictic seeds comprising: (a) transforming plant material with a nucleotide sequence encoding a protein which in active form in a cell or cell membrane renders the cell embryogenic; (b) regenerating the transformed material into plants or carpel-containing plant parts; and (c) expressing the sequence in the vicinity of the embryo sac. The apomictic seeds and embryos thus produced can be developed into plant progeny. This is useful in plant breeding programs. Controllable and reproducible apomixis provide
                                                                                                                                                                                                                                                                                                                                                                                                                            intron

Apomixis provides for true-breeding, seed propagated hybrids and could shorten and simplify the breeding process so that selfing and progeny testing to produce and/or stabilise a desirable gene combination could be eliminated. Apomixis allows plant breeders to develop cultivars with specific stable traits for such characteristics as height, seed and forage quality and maturity.

The sequence is that encoding SERK, a putative receptor kinase. It may be used as part of a method of producing apomictic seeds comprising: (a) transforming plant material with a nucleotide sequence encoding a protein which in active form in a cell or cell membrane renders the cell embryogenic; (b) regenerating the transformed material into plants or carpel-containing plant parts; and (c) expressing the sequence in the vicinity of the embryo sac: The apomictic seeds and embryos thus produced can be developed into plant progeny. This is useful in plant breeding programs. Controllable and reproducible apomixis provides many advantages in plant improvement and cultivar development in the case that sexual plants are available as crosses with the apomictic plant. Apomixis provides for true-breeding, seed process so that selfing and progeny testing to produce and/or stabilise a desirable gene combination could be eliminated. Apomixis allows plant breeders to develop cultivars with seed apomixis allows plant breeders to develop cultivars with seed apomixis allows plant breeders to develop cultivars with seed apomixis allows plant breeders to develop cultivars with seed apomixis allows plant breeders to develop cultivars with seed and forage quality and maturity.

DNA encoding plant morphogenesis regulatory protein - useful yield plants with short stems or altered inflorescence Claim 1; Pages 6-10; 1/pp; Japanese.
The present sequence encodes an Arabidopsis thaliana plant morphogenesis regulatory protein (MRP), which can be used to a plant with, e.g. short stems or altered inflorescence. The acts on a plant at a specific site for a specific period, and
                                                                                                                                                                                                                                           04-MAR-1997.

Increasing plant pathogen resistance by induction of variegation—may lead to acquired resistance to a broad range of pathogens.

Claim 9; Page 85-87; 13pp; Engilish.

T06307 is a tomato pathogen resisitance gene Cf-2.2 partial cDNA clone. In a new method this gene is expressed highly in genetic constructs which may be used to impart a broad range of pathogen resistance, by induction of variegation, to transgenic plants (or parts or propagules of plants) containing such constructs. Cf-2.2 imparts resistance to the disease caused by the leaf mould fungal pathogen Cladosporium fullyum. C.fulvum contains avirulence (Avr) genes that confer recognition by plants containing Cf-genes, leading to the activation of host defence mechanisms to attack the disease.

The MRP'S CDNA or genomic DNA can be used to transfor plant to increase its MRP expression, and therefore control form (particularly stem length) of the plant.

                                                            increasing plant pathogen resistance by induction of variegation may lead to acquired resistance to a broad range of pathogens.

Claim 9; Page 80-83; 111pp; English.

706306 is the tomato pathogen resisitance gene Cf-2.1. In a new method this gene is expressed highly in genetic constructs which may be used to impart a broad range of pathogen resistance, by induction of variegation, to transgenic plants (or parts or propagules of plants) containing such constructs. Cf-2.1 imparts resistance to the disease caused by the leaf mould fungal pathogen Cladosporium fulvum.

C.fulvum contains avirulence (Avr) genes that confer recognition by plants containing Cf-genes, leading to the activation of host defence mechanisms to attack the disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              δÃ
                                                                                     밁
                                                                            PS Claim 3; Fig 1a; 75pp; English.

PS Claim 3; Fig 1a; 75pp; English.

CC This sequence is an example of the polynucleotide of the invention, and CC is able to confer pathogen resistance on a plant. It is one of two tomato CC the gene variants, which offer resistance against the pathogen CC CF-5 gene variants, which offer resistance apainst the pathogen CC cladosporium fulvum-5. Transgenic plants can be produced by incorporating CC the gene into plant cells and regenerating plants from the cells; CC assaually or sexually produced offspring can also be subsequently CC produced. Expression of the gene in plant cells can confer pathogen CC resistance on a plant e.g. to tomato leaf mould (C. fulvum) in tomatoes. CC oligonucleotides with sequences complementary to the gene expression. The nucleic acids/polynucleotides are useful as hybridisation probes to CC identify other genes/fragments conferring pathogen resistance on plants CC e.g. phytophthora resistance in potatoes. Homologies between Cf-5 and CC cf-9 may be used to identify further resistance genes of this class.

For Tomato gene Cf-5, confers resistance to Cladosporium fulvum - useful production of transgenic plants resistant to pathogens e.g.

For tomato leaf mould C. fulvum in tomatoes

PS Claim 6; Fig 1b; 75pp; English.

CT his sequence is an example of the polynucleotide of the invention, and cis able to confer pathogen resistance on a plant. It is one of two tomato CC CF-5 gene variants, which offer resistance against the pathogen cC Cladosporium fulvum-5. Transgenic plants can be produced by incorporating cC cladosporium fulvum-5. Transgenic plants can be produced by incorporating cC caseaually or sexually produced offspring can also be subsequently cC produced. Expression of the gene in plant cells can confer pathogen cC cesistance on a plant e.g. to tomato leaf mould (C. fulvum) in tomatoes.

CC Oligonucleotides with sequences complementary to the gene or fragments confering other gene expression. The cc clearity other genes/fragments conferring pathogen resistance on plants ce.g. Phytophthora resistance in potatoes. Homologies between Cf-5 and CC c.g. Phytophthora resistance in potatoes. Homologies between Cf-5 and CC c.g. against class.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            В
                                                                          PT Tomato gene Cf-5, confers resistance to Cladosporium fulvum - useful PT for production of transgenic plants resistant to pathogens e.g. PT tomato leaf mould C. fulvum in tomatoes
PS Disclosure; Fig 7; 75pp; English.

CC This sequence is a clone of the polynucleotide of the invention, which offer CC the invention is one of two tomato CF-5 gene variants, which offer CC tresistance against the pathogen resistance on a plant. The polynucleotide of CC can be produced by incorporating the gene into plant cells and CC regenerating plants from the cells; asexually or sexually produced CC offspring can also be subsequently produced. Expression of the gene in CC plant cells can confer pathogen resistance on a plant e.g. to tomatoe complementary to the gene or fragments of it, are useful in anti-sense techniques to reduce gene expression. The nucleic acids/polynucleotides CC are useful as hybridisation probes to identify other genes/fragments CC conferring pathogen resistance on plants e.g. Phytophthora resistance in CC potatoes. Homologies between Cf-5 and Cf-9 may be used to identify Sequence 4123 BP; 1253 A; 742 C; 725 G; 1403 T;

GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Wang, Guo-Liang
APPLICANT: Wang, Guo-Liang
APPLICANT: Song, Wen-Yuang
TITLE OF INVENTION: Procedures and Materials for Conferring
TITLE OF INVENTION: Disease Resistance in Plants
TITLE OF SECUENCES: 15
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 1, Applic
Patent No. 5859339
                                                                                                                                                                                      REGISTRATION NUMBER: 34,774
REFERENCE/DOCKET NUMBER: 0237.
TELECOMMUNICATION INFORMATION:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /note="Vector: lambda Zip-Lox; Site_1: Sal; Site_2: Not; Lambda PRI2 is a cDNA library derived from equal quantities of 4 pools of mRNA. The mRNA sources were 1) 7 day germinated etiolated seedlings; 2) tissue culture grown roots; 3) staged plants half with 24 hour light cycle, half on 16 hr light, 8 hour dark-rosettes; 4) same plants as 3 but aerial tissue (stems, flowers and siliques. The vector is BRL's lambda Zip-Lox. The cDNA inserts were directionally cloned with Sal-Not arms using oligo dT primed cDNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Lambda PRL2 is a cDNA library derived from equal quantities of 4 pools of mRNA. The mRNA sources were 1) 7 quantities of 4 pools of mRNA. The mRNA sources were 1) 7 day germinated etiolated seedlings; 2) tissue culture grown roots; 3) staged plants half with 24 hour light cycle, half on 16 hr light, 8 hour dark-rosettes; 4) same plants as 3 but aerial tissue (stems, flowers and siliques. The vector is BRL's lambda Zip-Lox. The cDNA inserts were directionally cloned with Sal-Not arms using oligo dT primed cDNA. "

The mRNA sources were 1) 7 day germinated etiolated seedlings; 2) tissue culture grown roots; 3) staged plants half with 24 hour light cycle, half on 16 hr light, 8 hour dark rosettes; 4) same plants as 3 but aerial tissue (stems, flowers and siliques. The vector is BRL's lambda Zip-Lox. The cDNA inserts were directionally cloned with Sal-Not arms using oligo dT primed cDNA. "

                                                                                                                                                                                                                                                                                                                                       /notes vector: lambda Zip-Lox; Site_1: Sal; Site_2: Not; Lambda PRL2 is a cDNA library derived from equal quantities of 4 pools of mRNA. The mRNA sources were 1) 7 day germinated eticlated seedlings; 2) tissue culture grown roots; 3) staged plants half with 24 hour light cycle, half on 16 hr light, 8 hour dark-rosettes; 4) same plants as 3 but aerial tissue (stems, flowers and siliques. The vector is BRL's lambda Zip-Lox. The cDNA inserts were directionally cloned with Sal-Not arms using oligo dT primed cDNA.
